FOREWORD

Government of Maldives is committed to improve the health and well being of the people of Maldives through affordable and quality health services and by providing better access to health care. In achieving this goal we will continue our efforts to provide better services through a decentralized service model with increased involvement of local people and development of an effective referral system. The role of private sector in the health service provision needs to be streamlined and strengthened, especially within the Atolls.

Health Statistics is the measuring stick without which we will not have objective information and evidence on our performance. Therefore it is imperative to have timely and accurate data for monitoring health services and quality of care throughout the country. It is also important to formulate evidence based health policies in line with the National Plans and international commitments such as the Millennium Development Goals (MDGs). Furthermore, it is essential that quality and timely information is collected, analyzed and proper indicators generated to reflect the current health situation of the country so that appropriate measures can be taken to maintain or bring about necessary health reform.

The Maldives Health Statistics 2011 is the fifth publication of this nature, providing a summary of health statistics for Maldives. The information in the publication represents data from the year 2009 and 2010 with comparative figures for past ten years so that trends can be observed for a meaningful period of time.

This report has come into existence with the hard work of several staff without whom this cannot be done and I sincerely acknowledge the dedicated work of the management and staff of previous Decision Support Decision as well as the staff of the current Health Information Unit – Health Information Project Monitoring and Coordination Section of Ministry of Health and Family. I envisage extensive use of this publication by policy makers, researchers, and students and hope that it will provide easy access to comprehensive health statistics and help in strengthening evidence based decision making within the health sector and other sectors of the country.

Dr. Ahmed Jamsheed Mohamed

Minister of Health & Family

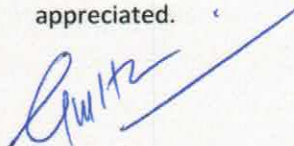

ACKNOWLEDGEMENTS

The Maldives Health Statistics 2011 was initiated by the management and staff of previous Decision Support Decision and completed by the staff of Health Information Unit - Health Information Project Monitoring and Coordination Section of the Ministry of Health and Family (MOHF). This publication is made a success as a result of the contribution from several concerned authorities and stakeholders; the Health Care Institutions, Centre for Community Health and Disease Control (CCHDC), National Social protection Agency (NSPA), Maldives Food and Drug Authority (MFDA), National Thalassaemia Centre, Department of National Planning, Maldives Police Services and Maldives Customs Services. The demographic information provided by Department of National Planning was used in calculating several of the indicators. We sincerely acknowledge the support and cooperation of these authorities for providing the necessary information.

A large part of the data contained in this publication is derived from the National Vital Statistics System (VSS) maintained by the Ministry of Health and Family. The data for this system is obtained from the National Vital Registration System (VRS) maintained at Department of National Registration. Our sincere appreciation goes to the dedicated staff of the Health Information Unit of MOHF and data entry and management staff of VRS at the Department of National Registration.

Our appreciation also goes to the dedicated staff at former Decision Support Division of Ministry of Health & Family and Department of National Registration who worked tirelessly in data entry, updating and verifying the Vital Statistics System, from where the majority of the data contained in publication is derived from. Vital Registration System has been updated with thousands of birth and death records and cross checked with manual forms with the input of several staff of the former Decision Support Division who are currently carrying out the same work at Department of National Registration. Our recognition also goes to Ms. Mariyam Mohamed for compiling and generation of tables, Mr. Abdulla Sham Zahir and Mr. Hussain Aneel for resolving technical issues with the Vital Registration System and enhancing the database, Ms. Aiman Waheed for designing the layout and cover for the publication. Furthermore, data verification provided by Mr. Abdul Bari Abdulla, Ms. Maimoona Aboobakur, Ms. Mariyam Nazviya and Ms. Aiman Waheed is deeply appreciated.

Geela Ali

Permanent Secretary

EXECUTIVE SUMMARY

The Maldives Health Statistics is published mainly to provide easy access to detailed statistical information reflecting the current health status of the country. It is essential to review the available statistics and analyze the trends for evidence based decision making and contributes to timely reporting of international health data collection requirements such as the monitoring of Millennium Development Goals.

This publication provides a wide compilation of statistics mainly coming from the routine data collection systems. Data and statistics on natality and mortality come from the Vital Registration System. Morbidity data is derived from the disease surveillance systems, human resources, health care finance and other miscellaneous statistical information are generated from administrative records and public health programs. Some useful health indicators from surveys are also cited here for easy reference. This publication is intended to provide easy access to health related statistics in one place and provide an up-to-date revision of data published in previous years.

From the trends over the past 10 years, it can be seen that during the last ten years the population growth has become stable mostly due to decline in birth rates and death rates. However, it has to be noted that birth rates are slowly increasing in recent years and a rise in population growth rate is envisaged. In 2008 Crude Birth rate was 22 per 1000 live births while in 2009 it has increase to 24 per live births, but in 2010 there was a slight decrease at 22 per 1000 live births. Increase in, birth rates are predicted in the years to come as the dominating young population in the age structure of the population reaches the reproductive age.

Over the last decade or so Crude Death Rate (CDR) has stabilized between 3 and 4 per 1000 population, which mainly attributes to decline in infant and child mortality rates over the last two decades. Effective immunization programmes and access to better health care throughout the country has played a major role in the fall of death rates.

From observing the trends in the past 10 years it shows that the infant mortality rates (IMR) and child mortality rates have been declining even though the decline is not as rapid as it was in the 1980s and 1990s. In the past three years IMR has remained at 11 per 1000 live births and child mortality rate has fluctuated between 12 and 14 per 1000 live births. Reduction in Child Mortality Rate is one of the goals of the Millennium Development Goals (MDGs) and utmost priority has been placed to reduce the Child Mortality

Rate. The baseline data of 1990 indicates that Under-Five Mortality Rate stood at 48 per 1000 live births in 1990 while IMR stood at 34 per 1000 live births.

The MDG target for Maldives is to reduce Under Five Mortality to 16 per 1000 live births by the end of 2015. There is a significant improvement in Under Five Mortality Rate and Infant Mortality Rate as shown from the data of 2009 and 2010. In the year 2009, Under Five Mortality Rate was 12 per thousand live births while it increased to 13 per thousand live births in 2010. And Infant Mortality Rate has remained the same since 2008 till 2010 at 11 per 1000 live births. Although there are fluctuations, it can be expected that Maldives will achieve the MDG target of reducing Under Five Mortality by two thirds between the baseline year of 1990 and 2015. However, consistent efforts have to be made towards improving the Infant Mortality Rate, Under- Five Mortality Rate and Child Mortality. A greater challenge for further reduction in infant mortality now lies with reducing neonatal death rate as more than 70% of infant deaths are neonatal deaths. It is also significant to note that a large proportion of premature births occur each year and considerable effort is now being put to combat this issue by developing newborn care units in Atoll Hospitals and Health Centers. The large proportion of premature births among other factors may also contribute to the increased neonatal death rate.

Improvements in reducing Maternal Mortality is apparent by the reduction of Maternal Mortality Ratio (MMR) over the past years, which may be mainly due to efforts such as auditing of maternal deaths and improved accessibility of health services in the islands. One of the targets of the Millennium Development Goals is to reduce the Maternal Mortality Ratio by three quarters between 1990 and 2015. When considering the baseline indicator of 1990, given the available data at that time, MMR was at 500 per 100,000 live births. As such it is targeted to reduce the maternal mortality ratio to 125 per 100,000 live births by year 2015. From the efforts put into reducing Maternal Mortality it has declined over the years and In the year 2007 MMR was 46 per 100,000 live births. However in recent years the Maternal Mortality is increasing considerably and increased to 57 per 100,000 live births in 2008, 81 per 100,000 live births in 2009 and 112 per 100,000 live births in 2010. Even though, given the small population a single maternal death can have a large effect on the MMR of the country now is the time to be cautious and push special measures in place to bring the MMR on track. Moreover, factors such as unsafe abortions and drug abuse and other social behaviors have to be taken into consideration in bringing down the MMR.

Observing the morbidity trends, the prevalence and incidence rates of Tuberculosis (TB), is seen to have generally declined in the past few years. However, appropriate interventions and public health promotion activities need to be undertaken to maintain the low prevalence of TB. The HIV (Human Immuno Deficiency

Virus) status of Maldives shows that since 2008, only one Maldivian was tested positive. However, several HIV positive cases are found each year during expatriate medical examination and these workers are deported abroad. Although the prevalence may be low, there are alarming risk factors existing in Maldives such as the increased number of IV drug users (IDUs). Appropriate monitoring of the high risk groups and other measures need to be undertaken with regards to improving the HIV status of Maldives.

Vector borne diseases such as Dengue and Chikungunya are prevalent throughout the year and the data shows that Dengue fever is most prevalent during June to August in both 2009 and 2010 as well, therefore measures need to be taken to eliminate mosquito breeding grounds and take special precautions during the high peak seasons to reduce the number of Dengue cases.

On the morbidity end, it is also to be noted that proper data collection mechanisms need to be established for non-communicable diseases (NCDs) as the country is in transition to higher burden of NCDs from communicable diseases.

Human Resource and finance data has some limitations for updating statistics due to data not being properly compiled and analyzed, it can generally be observed that with the formation of health service corporations the number of health workforce has increased in this reporting period.

Overall it can be said that the trends show improvement in the health and well being of people of Maldives as evident from the health indicators such as Crude Death Rate, Infant Mortality Rate, Under-five Mortality Rate and Maternal Mortality Ratio. Consistent improvements in quality of services are crucial to sustain these developments and further the achievements. Improvements in data collection, collation and analysis are the gateways for proper monitoring of effectiveness of and application of evidence based decisions when formulating health policies.

Note: Under five mortality can be affected by slightly lower number of Live births compared to number of live births in 2009. The lower number may be due to the fact that we have not received all the births occurred abroad.

TBALE 57: ANAEMIA AMONG WOMEN –MICS 2001

	Percentage of women with any anaemia	Mild Anaemia ¹	Moderate Anaemia ²	Severe Anaemia ³	Number of Women
<i>Pregnant</i>	55.4%	31.1%	23.0%	1.4%	74
<i>Not pregnant</i>	49.6%	39.6%	9.1%	0.9%	1287

Source: Multiple Indicator Cluster Survey, 2001, Ministry of Health

¹Mild Anaemia (10.0-10.9 grams per decilitre (g/dl) for pregnant women and 10.0-11.9 (g/dl) for non pregnant women).

²Moderate Anaemia (7.0-9.9 grams per decilitre (g/dl) for all women).

³Severe Anaemia (less than 7.0 grams per decilitre (g/dl) for all women).

TABLE 58: ANAEMIA AMONG WOMEN – NMS 2007

Type of Anaemia	Anaemia Prevalence (percentage)
<i>Valid N</i>	1284
<i>Moderate Anaemia¹</i>	15.1%
<i>Severe Anaemia²</i>	0.3%

Source: National Micronutrient Survey, 2007, Ministry of Health

¹ Moderate Anaemia (7.0-10.9 grams per decilitre (g/dl))

²Severe Anaemia (less than 7.0 grams per decilitre (g/dl))
